

R Information and Download Instructions

We will be using R for some basic output on some of the STAT 322 assignments (you will ***NOT*** be tested on your knowledge of R commands on the midterm or final exam).

R is available as a free download from:

Macs: <http://cran.r-project.org/bin/macosx>

PC: <http://cran.r-project.org/bin/windows/base>

Once R is installed on your machine, you may wish to install *RStudio*, an integrated development environment (IDE) for R that has a more user-friendly interface. After R has been installed, RStudio may be downloaded and installed from <http://www.rstudio.com>.

I will typically provide you with basic information in the assignments on appropriate R commands. There are many web-based resources available on the use of R. For assignment purposes, a quick internet search will usually be sufficient to find what you are looking for. For example, in Assignment #1 Question 1), you will need to either import or enter in R the two rows of values provided. A quick search of “How do I enter [import] data in R” will yield a variety of excellent resources.
